| Rewrite radical expressions using rational exponents.                                  | <p>29. Write each of the following expressions in simplified exponential form.</p> <div style="display: flex; justify-content: space-around;"> <div style="width: 30%;">a. <math>\sqrt{x^3}</math></div> <div style="width: 30%;">c. <math>\sqrt[5]{x^3}</math></div> <div style="width: 30%;">e. <math>27\sqrt[6]{y^9}</math></div> </div>  |

Identify characteristics of polynomials.

31. Label each of the following as a monomial, binomial, or trinomial.

a.  $18z$                       b.  $-5y^2 + 4y - 7$

c.  $16ab^3cx$                   d.  $10 - 4x^2$

32. State the degree of each term.

a.  $3x^2$                   b.  $6xy^3$                   c.  $16$                   d.  $-8k$

33. State the degree and leading coefficient of each polynomial.

a.  $-5y^2 + 4y - 7$

b.  $4x^2 - 6x^4 + 3x - 2$

c.  $-x + 3$

34. Write the polynomial in descending order.

$6x^2 - x^4 + 10 + 3x$

*In Exercises 39–47, multiply and simplify.*

40.  $(-3x^2y)(2xy^3)(4x^2y^2)$

41.  $(3mx)(2mx^2) - (4m^2x)x^2$

42.  $ax^2(2x^2 + ax - ab)$

45.  $(3x + 2)(2x - 5)$

47.  $(a - 2b)(a^2 - 3ab + b^2)$

*In Exercises 48–53, find the special products.*

51.  $(6x - y)^2$

52.  $(2y + 5z)^2$

53.  $(3x^2 + 5y)(3x^2 - 5y)$

### 3.1 Quadratic Equations; Parabolas

#### Learning Outcomes and Notes

Describe characteristics of the graph of a quadratic function.

#### Graph of a Quadratic Function

The graph of the function

$$f(x) = ax^2 + bx + c$$

is a parabola that opens upward, and the vertex is a minimum, if  $a > 0$ . The parabola opens downward, and the vertex is a maximum, if  $a < 0$ .

The larger the value of  $|a|$ , the more narrow the parabola will be. Its vertex is at the point  $\left(\frac{-b}{2a}, f\left(\frac{-b}{2a}\right)\right)$  (Figure 3.7).

The axis of symmetry of the parabola has equation  $x = \frac{-b}{2a}$ .

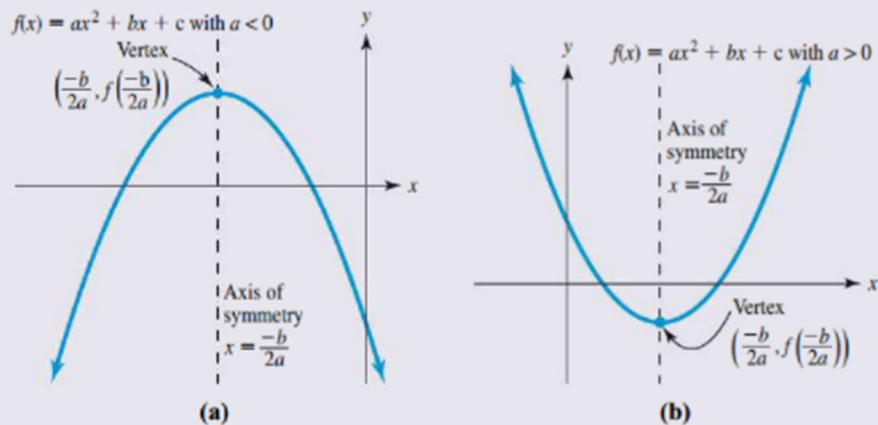

Figure 3.7

Graph quadratic functions in a given viewing window.

#### Examples

*In Exercises 1–6, (a) determine whether the function is quadratic. If it is, (b) determine whether the graph is concave up or concave down. (c) Determine whether the vertex of the graph is a maximum point or a minimum point.*

1.  $y = 2x^2 - 8x + 6$
2.  $y = 4x - 3$
3.  $y = 2x^3 - 3x^2$
4.  $f(x) = x^2 + 4x + 4$
5.  $g(x) = -5x^2 - 6x + 8$

*In Exercises 7–14, (a) graph each quadratic function on  $[-10, 10]$  by  $[-10, 10]$ . (b) Does this window give a complete graph?*

7.  $y = 2x^2 - 8x + 6$
10.  $h(x) = -2x^2 - 4x + 6$
11.  $y = x^2 + 8x + 19$

Write the equation of a quadratic function given a graph or points on the graph.

### Graph of a Quadratic Function

In general, the graph of the function

$$y = a(x - h)^2 + k$$

is a parabola with its vertex at the point  $(h, k)$ .

The parabola opens upward if  $a > 0$ , and the vertex is a minimum.

The parabola opens downward if  $a < 0$ , and the vertex is a maximum.

The axis of symmetry of the parabola has equation  $x = h$ .

The  $a$  is the same as the leading coefficient in  $y = ax^2 + bx + c$ , so the larger the value of  $|a|$ , the narrower the parabola will be.

15. Write the equation of the quadratic function whose graph is shown.

18. The two graphs shown have equations of the form  $y = -a(x - 3)^2 + 5$ . Is the value of  $|a|$  larger for  $y_1$  or  $y_2$ ?

19. If the points in the table lie on a parabola, write the equation whose graph is the parabola.

|          |    |    |    |     |
|----------|----|----|----|-----|
| <b>x</b> | -1 | 1  | 3  | 5   |
| <b>y</b> | -7 | 13 | -7 | -67 |

Find the coordinates of the vertex and graph quadratic functions.

*In Exercises 21–30, (a) give the coordinates of the vertex of the graph of each function. (b) Graph each function on a window that includes the vertex.*

21.  $y = (x - 1)^2 + 3$       23.  $y = (x + 8)^2 + 8$

26.  $f(x) = -0.5(x - 2)^2 + 1$

28.  $y = 3x + 18x^2$       29.  $y = 3x^2 + 18x - 3$

*For Exercises 31–34, (a) find the  $x$ -coordinate of the vertex of the graph. (b) Set the viewing window so that the  $x$ -coordinate of the vertex is near the center of the window and the vertex is visible, and then graph the given equation. (c) State the coordinates of the vertex.*

32.  $y = -3x^2 - 66x + 12$

34.  $y = 0.3x^2 + 12x - 8$

*In Exercises 35–40, sketch complete graphs of the functions.*

36.  $y = x^2 - 36x + 324$

38.  $y = -x^2 - 80x - 2000$

40.  $y = 2x^2 - 75x - 450$

Use the graph of a quadratic function to estimate the  $x$ -intercepts.

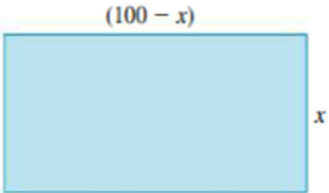

*Use the graph of each function in Exercises 41–46 to estimate the  $x$ -intercepts.*

41.  $y = 2x^2 - 8x + 6$       43.  $y = x^2 - x - 110$

45.  $g(x) = -5x^2 - 6x + 8$

|   |   |
|---|---|
| <p>Solve quadratic equations using the square root method.</p> <p><b>Square Root Method</b></p> <p>The solutions of the quadratic equation <math>x^2 = C</math> are <math>x = \pm \sqrt{C}</math>. Note that, when we take the square root of both sides, we use a <math>\pm</math> symbol because there are both a positive and a negative value that, when squared, give <math>C</math>.</p>                      | <p><i>In Exercises 29–34, use the square root method to solve the quadratic equations.</i></p> <p>29. <math>4x^2 - 9 = 0</math>    31. <math>x^2 - 32 = 0</math>    33. <math>(x - 5)^2 = 9</math></p>  |
| <p>Solve quadratic equations by completing the square.</p>  | <p><i>In Exercises 35–38, complete the square to solve the quadratic equations.</i></p> <p>36. <math>x^2 - 6x + 1 = 0</math>    38. <math>2x^2 - 9x + 8 = 0</math></p>  |
| <p>Solve quadratic equations using the quadratic formula.</p> <p><b>Quadratic Formula</b></p> <p>The solutions of the quadratic equation <math>ax^2 + bx + c = 0</math> are given by the formula</p> $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ <p>Note that <math>a</math> is the coefficient of <math>x^2</math>, <math>b</math> is the coefficient of <math>x</math>, and <math>c</math> is the constant term.</p> | <p><i>In Exercises 39–42, use the quadratic formula to solve the equations.</i></p> <p>41. <math>5x + 3x^2 = 8</math>    42. <math>3x^2 - 30x - 180 = 0</math></p>  |
| <p>Solve quadratic equations having complex solutions.</p>  | <p><i>In Exercises 49–54, find the exact solutions to <math>f(x) = 0</math> in the complex numbers and confirm that the solutions are not real by showing that the graph of <math>y = f(x)</math> does not cross the <math>x</math>-axis.</i></p> <p>50. <math>2x^2 + 40 = 0</math>    52. <math>(2x + 1)^2 + 7 = 0</math></p> <p>54. <math>x^2 - 5x + 7 = 0</math></p> |

Use the discriminant to determine the number of solutions of a quadratic equation.

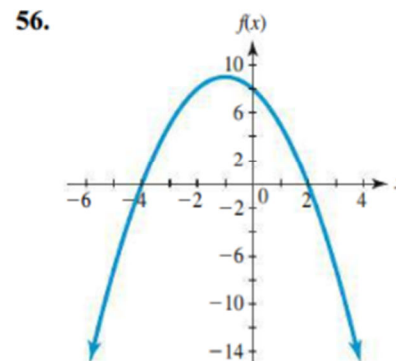

### The Discriminant

We can also determine the type of solutions a quadratic equation has by looking at the expression  $b^2 - 4ac$ , which is called the **discriminant** of the quadratic equation  $ax^2 + bx + c = 0$ . The discriminant is the expression inside the radical in the quadratic formula  $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ , so it determines if the quantity inside the radical is positive, zero, or negative.

- If  $b^2 - 4ac > 0$ , there are two different real solutions.
- If  $b^2 - 4ac = 0$ , there is one real solution.
- If  $b^2 - 4ac < 0$ , there is no real solution.

In Exercises 55–58, you are given the graphs of several functions of the form  $f(x) = ax^2 + bx + c$  for different values of  $a$ ,  $b$ , and  $c$ . For each function,

- Determine whether the discriminant is positive, negative, or zero.
- Determine whether there are 0, 1, or 2 real solutions to  $f(x) = 0$ .
- Solve the equation  $f(x) = 0$ , if possible.

For each function in Exercise 59–62,

- Calculate the discriminant.
- Determine whether there are 0, 1, or 2 real solutions to  $f(x) = 0$ .

59.  $f(x) = 3x^2 - 5x - 2$     62.  $f(x) = 4x^2 + 25$

|  |  |
|--|--|
| <p>Solve applications involving quadratic equations.</p> | <p><i>In Exercises 63–74, solve analytically and then check graphically.</i></p> <p><b>63. Flight of a Ball</b> If a ball is thrown upward at 96 feet per second from the top of a building that is 100 feet high, the height of the ball can be modeled by <math>S(t) = 100 + 96t - 16t^2</math> feet, where <math>t</math> is the number of seconds after the ball is thrown. How long after the ball is thrown is the height 228 feet?</p> <p><b>69. Wind and Pollution</b> The amount of particulate pollution <math>p</math> from a power plant in the air above the plant depends on the wind speed <math>s</math>, among other things, with the relationship between <math>p</math> and <math>s</math> approximated by <math>p = 25 - 0.01s^2</math>, with <math>s</math> in miles per hour.</p> <ol style="list-style-type: none"> <li>Find the value(s) of <math>s</math> that will make <math>p = 0</math>.</li> <li>What does <math>p = 0</math> mean in this application?</li> <li>What solution to <math>0 = 25 - 0.01s^2</math> makes sense in the context of this application?</li> </ol> |
|--|--|

### 3.3 Power and Root Functions

| Learning Outcomes and Notes   | Examples   |                      |                     |                     |                            |                                |                               |
|---|--|----------------------|---------------------|---------------------|----------------------------|--------------------------------|-------------------------------|
| <p>Identify power functions and describe characteristics of power functions.</p> <p><b>Power Functions</b><br/>           A <b>power function</b> is a function of the form <math>y = ax^b</math>, where <math>a</math> and <math>b</math> are real numbers, <math>b \neq 0</math>.</p> | <ol style="list-style-type: none"> <li>Which of the following are power functions?               <table style="width: 100%; border: none;"> <tr> <td style="width: 50%;"><b>a.</b> <math>y = 3x^4</math></td> <td style="width: 50%;"><b>b.</b> <math>d = q^4</math></td> </tr> <tr> <td><b>c.</b> <math>f = 3^x</math></td> <td><b>d.</b> <math>g(x) = x^{1/4}</math></td> </tr> </table> </li> <li>Rewrite each of the following as power functions of the form <math>y = ax^b</math>.               <table style="width: 100%; border: none;"> <tr> <td style="width: 50%;"><b>c.</b> <math>y = 3\sqrt[4]{x^5}</math></td> <td style="width: 50%;"><b>d.</b> <math>y = \frac{1}{x^2}</math></td> </tr> </table> </li> </ol> | <b>a.</b> $y = 3x^4$ | <b>b.</b> $d = q^4$ | <b>c.</b> $f = 3^x$ | <b>d.</b> $g(x) = x^{1/4}$ | <b>c.</b> $y = 3\sqrt[4]{x^5}$ | <b>d.</b> $y = \frac{1}{x^2}$ |

| <p>Find the quadratic function whose graph contains specified points.</p> | <p><i>In Exercises 1–6, write the equation of the quadratic function whose graph is a parabola containing the given points.</i></p> <ol style="list-style-type: none"> <li><math>(0, 1)</math>, <math>(3, 10)</math>, and <math>(-2, 15)</math></li> <li><math>(6, 30)</math>, <math>(0, -3)</math>, and <math>(-3, 7.5)</math></li> <li><math>(0, 6)</math>, <math>(2, \frac{22}{3})</math>, and <math>(-9, \frac{99}{2})</math></li> </ol> |

## Equation of a Quadratic Function

Find the equation of the quadratic function whose graph is a parabola containing the points  $(-1, 9)$ ,  $(2, 6)$ , and  $(3, 13)$ .

### SOLUTION

Using the three points  $(-1, 9)$ ,  $(2, 6)$ , and  $(3, 13)$ , we substitute the values for  $x$  and  $y$  in the general equation  $y = ax^2 + bx + c$ , getting three equations.

$$\begin{cases} 9 = a(-1)^2 + b(-1) + c \\ 6 = a(2)^2 + b(2) + c \\ 13 = a(3)^2 + b(3) + c \end{cases} \quad \text{or} \quad \begin{cases} 9 = a - b + c \\ 6 = 4a + 2b + c \\ 13 = 9a + 3b + c \end{cases}$$

We use these three equations to solve for  $a$ ,  $b$ , and  $c$ , using techniques similar to those used to solve two equations in two variables.\*

Subtracting the third equation,  $13 = 9a + 3b + c$ , from each of the first and second equations gives a system of two equations in two variables.

$$\begin{cases} -4 = -8a - 4b \\ -7 = -5a - b \end{cases}$$

Solve applications involving quadratic and power models.

**39. Mortgages** The balance owed  $y$  on a \$50,000 mortgage after  $x$  monthly payments is shown in the table that follows. Graph the data points with each of the equations below to determine which is the better model for the data, if  $x$  is the number of months that payments have been made.

a.  $y = 338,111.278x^{-0.676}$

b.  $y = 4700\sqrt{110 - x}$

| Monthly Payments | Balance Owed (\$) |
|------------------|-------------------|
| 12               | 47,243            |
| 24               | 44,136            |
| 48               | 36,693            |
| 72               | 27,241            |

Solve the resulting equation.</li> <li>5. All solutions must be checked in the original equation, and only those that satisfy the original equation are actual solutions.</li> </ol> | <p><i>In Exercises 1–20, solve the equations algebraically and check graphically or by substitution.</i></p> <p>2. <math>\sqrt{3x^2 + 4} - 2x = 0</math>      3. <math>\sqrt[3]{x - 1} = -2</math></p> <p>5. <math>\sqrt{3x - 2} + 2 = x</math>      7. <math>\sqrt[3]{4x + 5} = \sqrt[3]{x^2 - 7}</math></p> <p>10. <math>\sqrt{x} - 10 = -\sqrt{x - 20}</math></p> |
| <p>Solve equations with rational powers.</p>  | <p>12. <math>(x - 5)^{3/2} = 64</math></p> <p>14. <math>6x^{5/3} - 18 = 0</math></p>   |

Solve equations that are in quadratic form.

### Solving an Equation in Quadratic Form

Solve the equation  $x^4 - 5x^2 - 36 = 0$ .

#### SOLUTION

The equation contains an expression to a power,  $x^2$ , that expression to a power,  $(x^2)^2$ , and a constant. If we let  $u = x^2$ , we can solve the equation as follows.

$$\begin{aligned} x^4 - 5x^2 - 36 &= 0 \\ (x^2)^2 - 5(x^2) - 36 &= 0 && \text{Write the equation in quadratic form.} \\ u^2 - 5u - 36 &= 0 && \text{Substitute } u \text{ for } x^2. \\ (u - 9)(u + 4) &= 0 && \text{Factor the quadratic equation.} \\ u - 9 = 0 \quad u + 4 = 0 &&& \text{Use the zero-product property.} \\ u = 9 \quad u = -4 &&& \text{Solve for } u. \end{aligned}$$

Now we have solved our new equation for  $u$ , but we must go back and solve the original equation for  $x$ . To do this, we substitute  $x^2$  for  $u$  in the last two lines of the solution above:

$$\begin{array}{ll} u = 9 & u = -4 \\ x^2 = 9 & x^2 = -4 \\ x = \pm\sqrt{9} & x = \pm\sqrt{-4} \\ x = 3, -3 & x = 2i, -2i \end{array}$$

16.  $x^4 - 11x^2 + 18 = 0$

18.  $2x^{-2} + 3x^{-1} - 2 = 0$

19.  $2x^{2/3} + 5x^{1/3} - 12 = 0$

Solve quadratic inequalities.

### Solving a Quadratic Inequality Algebraically

- Write an equivalent inequality with 0 on one side and with the function  $f(x)$  on the other side.
- Solve  $f(x) = 0$ .
- Create a sign diagram that uses the solutions from step 2 to divide the number line into intervals. Pick a test value in each interval and determine whether  $f(x)$  is positive or negative in that interval to create a sign diagram.\*
- Identify the intervals that satisfy the inequality in step 1. The values of  $x$  that define these intervals are solutions to the original inequality.

*In Exercises 21–30, use algebraic methods to solve the inequalities.*

21.  $x^2 + 4x < 0$

23.  $9 - x^2 \geq 0$

24.  $x > x^2$

25.  $-x^2 + 9x - 20 > 0$

28.  $t^2 + 17t \leq 8t - 14$

29.  $x^2 - 6x < 7$

Solve power inequalities.

### Power Inequalities

To solve a power inequality, first solve the related equation. Then use graphical methods to find the values of the variable that satisfy the inequality.

In Exercises 35–42, solve the inequalities by using algebraic and graphical methods.

36.  $(x - 2)^3 \geq -2$       38.  $(x + 5)^4 > 16$

Solve absolute value inequalities.

For  $a \geq 0$ :

$|u| < a$  means that  $-a < u < a$ .

$|u| \leq a$  means that  $-a \leq u \leq a$ .

$|u| > a$  means that  $u < -a$  or  $u > a$ .

$|u| \geq a$  means that  $u \leq -a$  or  $u \geq a$ .

39.  $|2x - 1| < 3$       40.  $|3x + 1| \leq 5$

Solve applications involving additional equations and inequalities.

In Exercises 43–46, you are given the graphs of several functions of the form  $f(x) = ax^2 + bx + c$  for different values of  $a$ ,  $b$ , and  $c$ . For each function, (a) solve  $f(x) \geq 0$ , and (b) solve  $f(x) < 0$ .

43.

In Exercises 47 and 48, you are given the graphs of two functions  $f(x)$  and  $g(x)$ . Solve  $f(x) \leq g(x)$ .

47.

For what wind speeds between 0 mph and 90 mph is the wind chill temperature <math>-3^{\circ}\text{F}</math> or below?</p> <p><b>67. Purchasing Power</b> Inflation causes a decrease in the value of money used to purchase goods and services. The purchasing power of a 1983 dollar based on consumer prices for 1968–2010 can be modeled by the function <math>y = 34.394x^{-1.109}</math>, where <math>x</math> is the number of years after 1960. For what years through 2012 is the purchasing power of a 1983 dollar less than \$1.00, according to the model?</p> |

| Add and subtract complex numbers.    | <p><i>In Exercises 42–44, add or subtract, as indicated, and simplify.</i></p> <p>42. <math>(8 + 2i) + (-3 - 4i)</math></p> <p>43. <math>(-3 - 12i) - (9 + 6i)</math></p> <p>44. <math>(4 + i) + (2 - \sqrt{-4}) - (17 + 8i)</math></p>   |
| Multiply and divide complex numbers. | <p><i>In Exercises 45–52, perform the indicated operations and simplify.</i></p> <p>45. <math>(3 + 4i)(5 - 2i)</math></p> <p>46. <math>\frac{1 + 3i}{5 + 2i}</math></p> <p>47. <math>i^{17}(3i + 2)</math></p> <p>48. <math>\left(\frac{3 + \sqrt{-16}}{2}\right)^2</math></p> <p>49. <math>\frac{3 + 7i}{4i}</math></p> <p>50. <math>\frac{2 - \sqrt{-8}}{\sqrt{2} - \sqrt{-4}}</math></p> <p>51. <math>\frac{(3 - i)(7 + 2i)}{4 - 3i}</math></p> <p>52. <math>\sqrt{-4}\sqrt{-3}\sqrt{-24}</math></p> |

## 6.1 Higher-Degree Polynomial Functions

| Learning Outcomes and Notes | Examples  |
|-----------------------------|---|
| Graph cubic functions.      | <p>2. Graph the function <math>f(x) = 2x^3 - 3x^2 - 6x</math> on the windows given in parts (a) and (b). Which window gives a complete graph?</p> <p>a. <math>[-5, 5]</math> by <math>[-5, 5]</math></p> <p>b. <math>[-10, 10]</math> by <math>[-10, 10]</math></p> |

A **cubic function** in the variable  $x$  has the form

$$f(x) = ax^3 + bx^2 + cx + d \quad (a \neq 0)$$

The basic cubic function  $f(x) = x^3$  was discussed in Section 3.3. The graph of this function, shown in Figure 6.3(a), is one of the possible shapes of the graph of a cubic function. The graphs of two other cubic functions are shown in Figures 6.3(b) and (c).

Figure 6.3

Graph quartic functions.

## Quartic Functions

A polynomial function of the form  $f(x) = ax^4 + bx^3 + cx^2 + dx + e$ ,  $a \neq 0$ , is a fourth-degree, or **quartic**, function. The basic quartic function  $f(x) = x^4$  has the graph shown in Figure 6.7(a). Notice that this graph resembles a parabola, although it is not actually a parabola (recall the shape of a parabola, which was discussed in Section 3.1). The graph in Figure 6.7(a) is one of the possible shapes of the graph of a quartic function. The graphs of two additional quartic functions are shown in Figures 6.7(b) and (c).

Figure 6.7

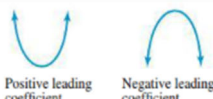

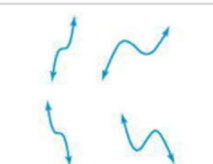

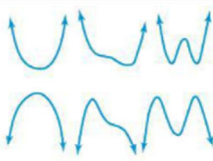

3. Graph the function  $g(x) = 3x^4 - 12x^2$  on the windows given in parts (a) and (b). Which window gives a complete graph?

a.  $[-5, 5]$  by  $[-5, 5]$     b.  $[-3, 3]$  by  $[-12, 10]$

Identify the degree, coefficient, and intercepts of graphs of higher-degree polynomial functions.

In general, the graph of a polynomial function of degree  $n$  has at most  $n$   $x$ -intercepts.

Table 6.3

| Function  | Possible Graphs   | Degree | Number of Turning Points | End Behavior  |   | Degree: Even or Odd |
|-----------|---|--------|--------------------------|---|---|---------------------|
|           |   |        |                          | Positive leading coefficient  | Negative leading coefficient  |                     |
| Linear    | <br>Positive slope      Negative slope                             | 1      | 0                        |  |  | odd                 |
| Quadratic | <br>Positive leading coefficient      Negative leading coefficient | 2      | 1                        |  |  | even                |
| Cubic     | <br>Positive leading coefficient<br>Negative leading coefficient   | 3      | 2 or 0                   |  |  | odd                 |
| Quartic   | <br>Positive leading coefficient<br>Negative leading coefficient   | 4      | 3 or 1                   |  |  | even                |

### Polynomial Graphs

1. The graph of a polynomial function of degree  $n$  has at most  $n - 1$  turning points.
2. The graph of a polynomial function of degree  $n$  has at most  $n$   $x$ -intercepts.
3. The end behavior of the graph of a polynomial function with odd degree can be described as “one end opening up and one end opening down.”
4. The end behavior of the graph of a polynomial function with even degree can be described as “both ends opening up” or “both ends opening down.”

For Exercises 5–10, use the given graph of the polynomial function to (a) estimate the  $x$ -intercept(s), (b) state whether the leading coefficient is positive or negative, and (c) determine whether the polynomial function is cubic or quartic.

5.

Identify the graphs of higher-degree polynomial functions.

For Exercises 11–16, match the polynomial function with its graph (below or on the next page).

11.  $y = 2x^3 + 3x^2 - 23x - 12$

12.  $y = -2x^3 - 8x^2 + 0.5x + 2$

13.  $y = -6x^3 + 5x^2 + 17x - 6$

14.  $y = x^4 - 0.5x^3 - 14.5x^2 + 17x + 12$

15.  $y = x^4 + 3$

16.  $y = -x^4 + 16x^2$

Identify the degree, coefficient, and intercepts of equations of higher-degree polynomial functions.

For Exercises 17–20, use the equation of the polynomial function to (a) state the degree and the leading coefficient and (b) describe the end behavior of the graph of the function. (c) Support your answer by graphing the function.

18.  $g(x) = 0.3x^4 - 6x^2 + 17x$

20.  $g(x) = -3(x - 3)^2(x - 1)^2$

Solve applications involving higher-degree polynomial functions.

41. **Investment** If \$2000 is invested for 3 years at rate  $r$ , compounded annually, the future value of this investment is given by  $S = 2000(1 + r)^3$ , where  $r$  is the rate written as a decimal.

a. Complete the following table to see how increasing the interest rate affects the future value of this investment.

| Rate, $r$ | Future Value, $S$ (\$) |
|-----------|------------------------|
| 0.00      |                        |
| 0.05      |                        |
| 0.10      |                        |
| 0.15      |                        |
| 0.20      |                        |

b. Graph this function for  $0 \leq r \leq 0.24$ .

c. Use the table and/or graph to compare the future value if  $r = 10\%$  and if  $r = 20\%$ . How much more money is earned at 20%?

d. Which interest rate, 10% or 20%, is more realistic for an investment?

Find local minima, local maxima, absolute minima, and absolute maxima of polynomial functions.

34. a. Graph  $y = x^4 - 8x^2$  on a window that shows 2 local minima and 1 local maximum.
- b. A local maximum occurs at what point?
- c. The local minima occur at what points?

## 6.2 Modeling with Cubic and Quartic Functions

| Learning Outcomes and Notes                              | Examples  |     |    |      |    |      |     |   |        |     |     |    |    |    |     |        |    |     |    |      |    |      |   |   |   |     |   |    |   |    |   |    |     |

Model and apply data with cubic functions.

**17. National Health Care** The following table shows the total national expenditures for health care (in billions of dollars) for selected years from 2002 and projected to 2024. (These data include expenditures for medical research and medical facilities construction.)

| Year | Amount | Year | Amount |
|------|--------|------|--------|
| 2002 | 1602   | 2014 | 3080   |
| 2004 | 1855   | 2016 | 3403   |
| 2006 | 2113   | 2018 | 3786   |
| 2008 | 2414   | 2020 | 4274   |
| 2010 | 2604   | 2022 | 4825   |
| 2012 | 2817   | 2024 | 5425   |

(Source: U.S. Centers for Medicare and Medicaid Services)

- Find a cubic function that models the data, with  $x$  equal to the number of years after 2000 and  $y$  equal to the expenditures for health in billions of dollars. Report the model with 4 significant digits.
- Graph the cubic function and the data on the same axes to determine if the function is a good fit for the data.
- What does the unrounded model predict the expenditures will be in 2032?

Model and apply data with quartic functions.

**21. Energy from Crude Oil** The table shows the total energy supply from crude oil products, in quadrillion BTUs, for selected years from 2010 and projected to 2040.

- a. Find the quartic function that is the best model for the data, with  $x$  equal to the number of years after 2010; let  $C(x)$  equal the number of quadrillion BTUs of energy. Report the model with three significant digits.
- b. Graph the model and the aligned data on the same axes and comment on the fit of the model to the data.
- c. What does the model predict the total energy supply from crude oil products will be in 2042?

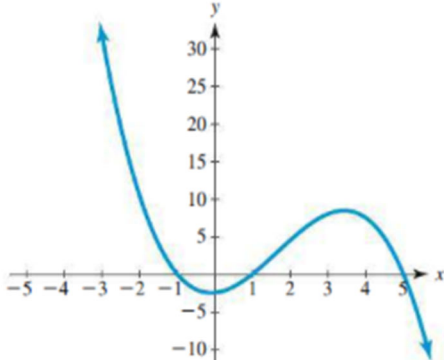

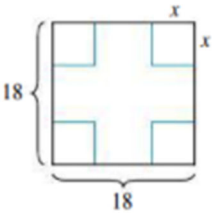

| Year | Quadrillion BTUs | Year | Quadrillion BTUs |
|------|------------------|------|------------------|
| 2010 | 11.6             | 2030 | 13.5             |
| 2015 | 15.6             | 2035 | 13.4             |
| 2020 | 16.0             | 2040 | 13.1             |
| 2025 | 14.5             |      |                  |

Use the formula <math>V = lwh</math> to find an equation that represents the volume of the box.</p> |

## Finding the Maximum Volume

A box is to be formed by cutting a square of  $x$  inches per side from each corner of a square piece of cardboard that is 24 inches on each side and folding up the sides. This will give a box whose height is  $x$  inches, with the length of each side of the bottom  $2x$  less than the original length of the cardboard (see Figure 6.22). Using  $V = lwh$ , the volume of the box is given by

$$V = (24 - 2x)(24 - 2x)x$$

where  $x$  is the length of the side of the square that is cut out.

Figure 6.22

- Use the factors of  $V$  to find the values of  $x$  that give volume 0.
- Graph the function that gives the volume as a function of the side of the square that is cut out over an  $x$ -interval that includes the  $x$ -values found in part (a).
- What input values make sense for this problem (that is, actually result in a box)?

### SOLUTION

- We use the zero-product property to solve the equation  $0 = (24 - 2x)(24 - 2x)x$ .

$$0 = (24 - 2x)(24 - 2x)x$$

$$x = 0 \quad \text{or} \quad 24 - 2x = 0$$

$$-2x = -24$$

$$x = 0 \quad \text{or} \quad x = 12$$

- A graph of  $V(x)$  from  $x = -1$  to  $x = 16$  is shown in Figure 6.23(a).
- The box can exist only if each of the dimensions is positive, resulting in a volume that is positive. Thus,  $24 - 2x > 0$ , or  $x < 12$ , so the box can exist only if the value of  $x$  is greater than 0 and less than 12. Note that if squares 12 inches on a side are removed, no material remains to make a box, and no squares larger than 12 inches on a side can be removed from all four corners.

- Use the equation that you constructed to find the values of  $x$  that make  $V = 0$ .
- For which of these values of  $x$  does a box exist if squares of length  $x$  are cut out and the sides are folded up?
